FOUNDEROS / FIELD GUIDE 02

BRAD BONANNO

THE WATCH SKILL INSTALL GUIDE

Let your AI watch video.

Install Watch once and Claude or ChatGPT can watch any video, find the moment you need and tell you what happens in it.

Every click from install to first video, plus the fixes for when it breaks.

Check where you run it.

Watch runs small programs on your computer to download and read video. That only works in apps that can run code on your machine, so pick your app first.

01 Works: Claude Code

The Code tab in the Claude desktop app, Claude Code in VS Code, or Claude Code in a terminal.

02 Works: ChatGPT Work and Codex

Work mode in the ChatGPT desktop app, plus the Codex app, CLI and IDE extension. Both need one network setting switched on (page 8).

03 Doesn't work: chat apps

Claude Chat, Claude Cowork, claude.ai in a browser and regular ChatGPT Chat can't run Watch. Uploading watch.skill into a chat doesn't work either.

PICK YOUR ROUTE

Claude Code	→	pages 3 and 4
ChatGPT Work	→	pages 5, 6 and 8
Codex	→	pages 7 and 8

THEN EVERYONE

Free Gemini key	→	page 9
First video	→	pages 10 and 11

Install it in Claude Code.

These steps use the Claude desktop app. Using Claude Code in a terminal or VS Code instead? Skip to the commands on the next page.

01 Open Customize, then Plugins

Click Customize in the left sidebar, then the Plugins tab at the top of the page.

02 Add the marketplace

Click Add at the top right and choose Add marketplace. Pick Add from a repository, paste the link below into URL, then click Sync.

<https://github.com/bradautomates/claude-video>

Install Watch, then check it.

Adding the marketplace only lists Watch. You still need to install it and open a new session before `/watch` shows up.

03 Install Watch

Find Watch in the claude-video marketplace and install it. When it's done, Watch sits under From marketplaces you added on the Plugins page.

04 Start a new Code session

Open the Code tab, not Chat or Cowork, and start a new session. Type `/watch` and pick `watch:watch` from the list.

TERMINAL OR VS CODE? TYPE THESE INSIDE CLAUDE CODE

```
/plugin marketplace add bradautomates/claude-video  
/plugin install watch@claude-video
```

Install it in ChatGPT Work.

Use the ChatGPT desktop app. Plugins live in the sidebar, and Watch only runs in Work mode, not Chat.

01 Open Plugins, then Add

Click Plugins in the left sidebar. At the top right, click Add, then choose Add a marketplace.

02 Paste the source

Type the text below into Source. Leave Git ref and Sparse paths empty, then click Add marketplace.

bradautomates/claude-video

Install it, then use Work.

The new marketplace shows up under the Personal tab. Install Watch from there, then open a chat in Work mode.

03 Install from Personal

On the Plugins page, click Personal. Find watch and click the + beside it. A Watch plugin installed message pops up at the top.

04 Open a Work chat

Click Work at the top of a new chat, because Chat won't run plugins. Type the command below and pick Watch: Watch.

`/watch`

Next: turn on network access (page 8).

Install it in Codex.

This works in the Codex app, CLI and IDE extension. The easiest route is to ask Codex to install it for you.

01 Paste this into Codex

Open a new Codex session, paste the prompt below into the message box and let it finish. You don't need Node or npm for this.

```
Use $skill-installer to install the watch skill from:  
https://github.com/bradautomates/claude-video/tree/main/skills/watch
```

02 Or use the terminal

Already have the Codex CLI? Run these in your computer's terminal, one at a time. Use this route or the prompt above, not both.

```
codex plugin marketplace add bradautomates/claude-video  
codex plugin add watch@claude-video
```

03 Start a new session

Close it and open a new session so Codex loads Watch. Then turn on network access on the next page, or Watch can't download video or reach Gemini.

Turn the network on.

ChatGPT Work and Codex keep the internet off by default. Watch needs it on to download videos and reach Gemini. On Claude Code? Skip this page.

01 Open your Codex config file

In Finder press Cmd + Shift + G, type ~/.codex and press Return. Open config.toml with TextEdit. No file there? Create one with that name.

```
Mac      ~/.codex/config.toml
Windows  %USERPROFILE%\codex\config.toml
```

02 Add these two lines, then save

Paste them at the bottom. Already have a [sandbox_workspace_write] line? Add only the second line under it.

```
[sandbox_workspace_write]
network_access = true
```

03 Quit and reopen the app

Fully quit ChatGPT or Codex (Cmd + Q) and open it again. One file covers the ChatGPT desktop app, the Codex CLI and the IDE extension, so you only do this once.

```
RATHER NOT EDIT FILES? PASTE THIS AND APPROVE THE CHANGE
Add network_access = true under [sandbox_workspace_write] in
~/.codex/config.toml. Keep everything else in the file the same.
```

Get a free Gemini key.

Watch hands the video to Google's Gemini, which watches the whole thing, picture and sound. The key is free to create and you don't need billing to start.

01 Create the key

Open the link below and sign in with Google. Click Create API key, name it Watch, pick your project and click Create key. Check the project says Free tier.

aistudio.google.com/apikey

02 Copy it and keep it private

Click the copy button next to your new key. Treat it like a password: don't post it, share it or screenshot it anywhere public.

USING PRIVATE RECORDINGS?

Google may use free-tier video to improve its products.
For anything confidential, pick Local on the next page.

Watch your first video.

Setup runs once, the first time you use Watch. The screenshots show Claude Code. ChatGPT Work and Codex look a little different but ask the same things.

01 Give it a video

Start a new session. Type `/watch`, paste a YouTube link and say what you want. Pick a video under ten minutes for your first run.

```
/watch https://www.youtube.com/watch?v=9q5ojtkqsBs  
break down the hook and why this video works
```

02 Pick Gemini (Recommended)

Watch asks how it should view videos. Choose Gemini. Local needs no key and keeps the video on your computer, but it reads sampled frames and the transcript instead of the whole video.

Add your key, then go.

Watch now asks for the key you copied on page 9. This is the last setup step, and you only do it once.

03 Pick Open config file

It keeps the key out of your chat.
A file called `.env` opens in
TextEdit.

04 Paste the key and save

Paste it straight after
`GEMINI_API_KEY=` with no
spaces or quotes. Save with
`Cmd + S`, then close the file.

05 Pick Done, key saved

Watch checks the key, then
Gemini watches your video. A
couple of minutes later you get a
timestamped answer.

Put it to work.

Four real sessions from my own week. Swap in your own link, and ask for what you'd ask a person who just watched it.

01 Break down a hook

/watch [link] break down the hook and why this video works

the idea of being a one-person department to people who don't own a business.

- **It ends with a simple 3-step plan (22:35-23:38):**
 1. Break your daily work into sub-tasks.
 2. Ask an AI how to automate the first one.
 3. When you get stuck, screenshot it and ask "what do I do now?"

This makes AI feel like a tutor rather than an engineering project.

Patterns you can reuse

This is my reading of Gemini's breakdown:

- **Every sentence in the first 20 seconds heads off a reason to leave:** "Is this relevant?" gets the news peg, "Is this hype?" gets "not fearmongering," and "Is this for me?" gets Main Street.
- **One core claim nobody can argue with does the persuading.** "Never worse than now" carries the whole video.
- **There's a graphic on almost every line of the hook, roughly every 2-4 seconds.** That pace is a big reason the talking head doesn't feel static.
- **The payoff promise comes at about 45 seconds,** once the stakes are already set, so the viewer wants the answer by the time it's offered.

02 Find one moment

/watch [link] find where he demos the token tool. Give me its name, website and timestamp

Find the demonstration where he types text into a tool that displays it as colored pieces with numbers beside it. Tell me the tools name and website and give me the timestamp

Ran 2 commands >

The tool is **Tiktokenizer**, at <https://tiktokenizer.vercel.app>. The demo starts at 12:20, when he introduces it and the site is shown on screen.

These timestamps come from Gemini, which watched the video. I haven't checked the frames myself.

- **12:20:** he introduces the site. The URL is in the browser bar and written on his whiteboard under "Step 2: Tokenization."
- **12:38-13:00:** he types "hello world". The right side splits it into colored tokens, with "hello" in blue and "world" in yellow, and shows their token IDs (15339, 1917).
- **13:03-13:50:** he changes the text ("helloworld", extra spaces, capital letters, "HELLO WORLD!?!?!") and the colored pieces and ID numbers update as he types.
- **13:58:** he pastes in a longer block of text.
- **~14:20:** the demo ends.

03 Explain a drop-off

/watch [link] use my retention analytics to find the three biggest drops and what caused them

			any of them..."	confirms the click. Some of this is normal home-feed bounce, but at 0.30 relative retention it's worse than similar videos.
2	0:16 → 0:21	77% → 68% (-9)	"now every one of them is a skill..." while the books turn into <i>/copy</i> , <i>/offer</i> , <i>/pricing</i> folders and a slash command gets typed	This is where it becomes a Claude skills tutorial. Viewers who came for book picks hear jargon, see slash commands and decide it isn't for them.
3	0:42 → 0:48	49% → 43% (-7)	The end of a steady 25-point bleed that starts at 0:21. First the agenda card ("I'll show you how to do it, then give you the five books"), then "But first, let me explain why Claude can't do this on its own"	The books get pushed back twice: behind a tutorial, then behind an explainer. The agenda card spells out that the books come third, and the list doesn't start until 4:25, when about 26% are left.

The bleed stops the moment you show your screen. At 0:52 the video cuts to a live Claude chat about Breakthrough Advertising, and the drop rate falls from about 5 points per 5 seconds to under 1. This fits two rules you already have

04 Turn it into notes

/watch [link] pull out the explanations, examples and demos and add them to my wiki

wiki / learning / karpathy-deep-dive-into-llms.md

Gemini 2.0 flash watching the video in 7 chapters aligned chunks. Those weren't checked frame by frame, so treat them as close but not exact. Written as paraphrase; bold terms are his names for concepts.

- **Dated:** recorded early 2025. The model line-up (GPT-4o, o3-mini, Anthropic having no thinking model, LM Arena rankings) is a snapshot from then. The mechanisms are what last.

The short version

ChatGPT is built in three stages, and Karpathy maps them onto a school textbook. **Pretraining** is reading the exposition: a neural net learns to predict the next token across ~15 trillion tokens of filtered internet text. The result is a **base model**, an internet document simulator that works like a lossy zip file of the web. **Supervised fine-tuning (SFT)** is studying worked examples: the same training on a much smaller dataset of human-written ideal conversations, which turns the simulator into an assistant. So when you talk to ChatGPT you're talking to a statistical simulation

Update it and switch modes.

Watch gets regular fixes. Update it the same way you installed it, then start a new session so the new version loads.

01 Update in Claude Code

Open Customize, then Plugins, click Watch and click Update. In a terminal, type `/plugin update watch@claude-video` instead.

02 Update in ChatGPT Work or Codex

Run these in your terminal. Installed with the prompt on page 7? Ask Codex to update the watch skill from the same link.

```
codex plugin marketplace upgrade claude-video
codex plugin add watch@claude-video
```

03 Switch between Gemini and Local

Just ask. Watch changes its own setting and asks for a key if it needs one.

```
/watch switch my engine to the gemini backend and add my api key
/watch switch my engine to local
```

When it breaks.

Find what you're seeing on the left. Most of these take under a minute to fix.

/watch doesn't show up	Install Watch itself, not just the marketplace, then start a new session in Code or Work.
Works in Code, not Chat	Expected. Claude Chat, Cowork and regular ChatGPT Chat can't run Watch. Use Code, Work or Codex.
Network error	In ChatGPT Work or Codex, network access is off. Add the setting on page 8, then quit and reopen.
Gemini key error	In ~/.config/watch/.env the key must sit right after GEMINI_API_KEY= with no spaces or quotes.
Gemini quota or 429	You've hit Google's free limit for now. Wait a while, or ask Watch to use local for this video.
Private video won't open	Gemini opens public YouTube links only. Download the video and give Watch the file on local.
Missing ffmpeg or yt-dlp	Local mode needs them. Ask: use the watch skill's setup.py to check what's missing and install it.
YouTube 403 error	Update yt-dlp (brew upgrade yt-dlp on a Mac) and try once more. Watch needs the latest version.
Can't add a marketplace	On a work account your admin may control plugins. Ask them, or install on a personal account.
Answer misses details	Long videos lose detail. Ask about one section, or add --start 2:15 --end 2:45 to your prompt.

Build an AI Operating System that runs your business.

Watch is one skill from my setup. In the two-week bootcamp I hand over all of it, then teach you to adapt it to your business.

01 Early access

You'll get the first chance to enrol before I open it to everyone else. Seats will be limited.

02 The founding price

Get access to the founding price, the cheapest the bootcamp will ever be.

03 Bonus support

Get a bonus waitlist-exclusive call with me two weeks after the bootcamp.

Join the waitlist →
